Security

The growth in security breaches continues to be an ever-present issue for every organization. These threats are very real and have the attention of CIOs today. Most attacks happen as result of improperly configured PCs or because users unknowingly expose their devices by downloading payloads or launching web pages that infect a system. Further, older releases of Windows were never designed to fully address the wide variety of spam, malware, or phishing that plague organizations today. Organizations also struggle balancing risk management, governance, and other security initiatives that impact business goals. Windows 10 ushers in many new changes that help address security and data concerns that exist with pre-Windows 10 environments:

	 Windows 7	 Windows 10	New Technology
Identity Protection	Theft of passwords possible/likely; multifactor too complex	Multifactor authentication is native and easy	Windows Hello Microsoft Passport
Data Protection	Disk encryption complex and difficult often requiring third-party integration	Disk encryption enabled by default; cross DLP functionality between Windows, Cloud, apps	BitLocker Enterprise Data Protection
Threat Resistance	Thousands of malware threats on a daily basis; AV can't keep up	Malware become irrelevant; Windows will only run trusted apps	Device Guard Windows Defender
Hardware Security	Device integrity nearly impossible; malware attacks holes in hardware configurations	System integrity maintained through hardware; hardware no longer exposed to malware	Secure Boot TPM Virtualization Health Attestation
